

Following are the closeouts for the action items generated during Software Design Review Committee meeting for SPACecraft Status Display and Commanding Software (SPASDACS) 1.0 held on 08/10/2021 & 26/10/2021.

No.	Deliberations/Actions	Actionee	Closeout
1.	Committee appreciated the Software for the extensive features available for analysis of the behavior of Spacecraft subsystems visually.	NA	NA
2.	To ensure the consistency in the Database parameters, Committee suggested to automate SPASDACS software interface with ACSS instead of taking the parameters manually.	Designers	These features are deferred for implementing in next version of SPASDACS. For all these features the complete telemetry database access to be made available to SPASDACS. After UMACS database schema and interfaces finalization these features will be implemented.
3.	For configuring the visual attributes of the Spacecraft elements, the possible values like messages of status parameters and limits of analog parameter to be shown to the User through auto-completion features.	Designers	
4.	Software shall be more intelligent and User-friendly to handle Digital and Analog parameters. Presently User needs to know the type of the parameter and different values it can have, which may be avoided.	Designers	
5.	Unauthorized user who knows the Javascript can edit the visual element features, but may not be allowed to save. Committee suggested not to allow this.	Designers	This is not possible to achieve in web-application. Even in net banking, user can edit and show account balance, however he can't update data at server side. As the changes are not persisted this will not cause any problems.
6.	Even if there is syntax error during the creation of visual element, it is brought to final display. Such visual elements are not operational as intended by the user. This may cause wrong analysis, which has to be avoided.	Designers	If syntax error is present, the elements are not operational at all. It is like static image as if no telemetry assigned to that element.
7.	User needs to configure for each and every parameter on the required TM stream. It is suggested to handle all TM streams by default and provision to	Designers	This will be implemented in next version of SPASDACS.

Version : 1.0

	mention the required TM stream for the selected parameter.										
8.	Presently the first user registration is taken as administrator. This is not acceptable. Designers can plan and design for User account administration.	Designers	This will be implemented in next version of SPASDACS.								
9.	Software can have a logging feature to log all the changes in the visual attributes of the Spacecraft elements displayed to the User.	Designers	This will be implemented in next version of SPASDACS.								
10.	The configuration changes made to a Spacecraft element, which is currently being displayed on a client, should be reflected automatically on all the other client displays.	Designer	Complied. Software updated to handle this requirement.								
11.	All the diagrams, files and associated information should be stored in a central repository and import provision to be provided for the Users to retrieve and configure across projects.	Designer	The formal mechanism for maintaining central repository will be worked out. At present user can copy files from other project.								
12.	Interface with ACSS to be specified in the SRS and design details to be put in the SDD.	Designer	Complied. SDD updated.								
13.	Committee expressed apprehension on the following: 1. Features provided to the Users to configure the visual elements through a programming language environment. Designers shall look into it and User friendly interface shall be provided. 2. Software does not validate the parameter mapped with the visual element. User has to take care of mapping. 3. Due to usage of various open source libraries in the software, there is a concern on the resources consumed by the software. Designers clarified that during the execution of the software, resources consumed are very less. However committee suggested that designers shall provide a report on the load testing of the software.	Designer	13.1 It was designed to give at most control to the user for handling complex scenarios. However in next version we will try to simplify the interface for usability. 13.2 Parameter mapping to the visual elements is like a database for this application. Auto validation of user intentions are not possible only syntax validation, mnemonics correctness can be validated which is already in place. 13.3.<table><tr><th>Library Name</th><th>Memory (KB)</th></tr><tr><td>GSAP</td><td>62</td></tr><tr><td>ANIME</td><td>18</td></tr><tr><td>SNAP SVG</td><td>81</td></tr></table>These values are very minimal.	Library Name	Memory (KB)	GSAP	62	ANIME	18	SNAP SVG	81
Library Name	Memory (KB)										
GSAP	62										
ANIME	18										
SNAP SVG	81										
14.	Committee wanted a demo on the software in RISAT-1A Checkout to	Designer	Demo will be arranged whenever S/C is on.
